The [Alpha chair](#) is a classic, sturdy, solid wood chair that's made from the latest production technologies.

[Made in Ratio](#), founded by designer Brodie Neill, used CNC routing technique to be a high-production tool rather than just a prototyping technology. The chair even uses digital sculpting, rather than forming it from a mold.

Its strong, A-shaped structure gives it a seamless appearance, which contrasts with more traditional furniture where joinery is visible. All components join organically into one, smooth chair.

After surviving a quarter life crisis, Nanette went from working in healthcare to pursuing her loves of design, food and writing. During the day she works in social media marketing, by night she writes for Design Milk. You can find more of her work at nanettewong.com.
